

**Table of Contents**  
***Optical Network Design and Planning, 2<sup>nd</sup> Edition***  
**By Jane M. Simmons**

**Chapter 1 Introduction to Optical Networks**

- 1.1 Brief Evolution of Optical Networks
- 1.2 Geographic Hierarchy of Optical Networks
- 1.3 Layered Architectural Model
- 1.4 Interfaces to the Optical Layer
  - 1.4.1 SONET/SDH
  - 1.4.2 Optical Transport Network (OTN)
- 1.5 Optical Control Plane
- 1.6 Terminology
- 1.7 Network Design and Network Planning
- 1.8 Research Trends in Optical Networking
- 1.9 Focus on Practical Optical Networks
- 1.10 Reference Networks
  - 1.10.1 Traffic Models
- 1.11 References

**Chapter 2 Optical Network Elements**

- 2.1 Introduction
- 2.2 Basic Optical Components
- 2.3 Optical Terminal
  - 2.3.1 Colorless Optical Terminal (Slot Flexibility)
- 2.4 Optical-Electrical-Optical (O-E-O) Architecture
  - 2.4.1 O-E-O Architecture at Nodes of Degree-Two
  - 2.4.2 O-E-O Architecture at Nodes of Degree-Three or Higher
  - 2.4.3 Advantages of the O-E-O Architecture
  - 2.4.4 Disadvantages of the O-E-O Architecture
- 2.5 Optical Bypass
  - 2.5.1 Advantages of Optical Bypass
  - 2.5.2 Disadvantages of Optical Bypass
- 2.6 OADMs/ROADMs
  - 2.6.1 OADM Reconfigurability
- 2.7 Multi-Degree ROADMs
  - 2.7.1 Optical Terminal to ROADM to ROADM-MD Upgrade Path
- 2.8 ROADM Architectures
  - 2.8.1 Broadcast-and-Select Architecture
  - 2.8.2 Route-and-Select Architecture
  - 2.8.3 Wavelength-Selective Architecture
- 2.9 ROADM Properties
  - 2.9.1 Cascadability
  - 2.9.2 Automatic Power Equalization
  - 2.9.3 Colorless
  - 2.9.4 Directionless
  - 2.9.5 Contentionless
  - 2.9.6 Gridless
  - 2.9.7 Wavelength vs. Waveband Granularity
  - 2.9.8 Multicast
  - 2.9.9 East/West Separability (Failure/Repair Modes)
  - 2.9.10 Wavelength Reuse

- 2.10 Optical Switch Types
  - 2.10.1 O-E-O Optical Switch
  - 2.10.2 Photonic Switch
  - 2.10.3 All-Optical Switch (ROADM)
  - 2.10.4 Fiber Cross-Connect
  - 2.10.5 Grooming Switch
- 2.11 Hierarchical or Multi-Granular Switches
- 2.12 Optical Reach
- 2.13 Integrating WDM Transceivers in the Client Layer
- 2.14 Packet-Optical Transport
- 2.15 Photonic Integrated Circuits
- 2.16 Multi-Fiber-Pair Systems
- 2.17 Exercises
- 2.18 References

### **Chapter 3 Routing Algorithms**

- 3.1 Introduction
- 3.2 Shortest Path Algorithms
- 3.3 Routing Metrics
  - 3.3.1 Minimum-Hop Path vs. Shortest-Distance Path
  - 3.3.2 Shortest-Distance Path vs. Minimum-Regeneration Path
- 3.4 Generating a Set of Candidate Paths
  - 3.4.1 K-Shortest Paths Strategy
  - 3.4.2 Bottleneck-Avoidance Strategy
- 3.5 Routing Strategies
  - 3.5.1 Fixed-Path Routing
  - 3.5.2 Alternative-Path Routing
  - 3.5.3 Dynamic-Path Routing
- 3.6 Capturing the Available Equipment in the Network Model
  - 3.6.1 O-E-O Network
  - 3.6.2 Optical-Bypass-Enabled Network
- 3.7 Diverse Routing for Protection
  - 3.7.1 Shortest Pair of Disjoint Paths
  - 3.7.2 Minimum-Regeneration Pair of Disjoint Paths
  - 3.7.3 Shortest Pair of Disjoint Paths: Dual-Sources/Dual-Destinations
  - 3.7.4 Shared Risk Link Groups (SRLGs)
  - 3.7.5 Routing Strategies with Protected Demands
- 3.8 Routing Order
- 3.9 Flow-Based Routing Techniques
- 3.10 Multicast Routing
  - 3.10.1 Minimum Spanning Tree with Enhancement
  - 3.10.2 Minimum Paths
  - 3.10.3 Regeneration in a Multicast Tree
  - 3.10.4 Multicast Protection
  - 3.10.5 Manycast
- 3.11 Multipath Routing
  - 3.11.1 Non-Disjoint Multipath Routing
  - 3.11.2 Disjoint Multipath Routing
- 3.12 Exercises
- 3.13 References

### **Chapter 4 Regeneration**

- 4.1 Introduction

- 4.2 Factors That Affect Regeneration
  - 4.2.1 Optical Impairments
  - 4.2.2 Network Element Effects
  - 4.2.3 Transmission System Design
  - 4.2.4 Fiber Plant Specifications
  - 4.2.5 Mitigation of Optical Impairments
  - 4.2.6 Mixed Line-Rate Systems
  - 4.2.7 System Regeneration Rules
- 4.3 Routing with Noise Figure as the Link Metric
  - 4.3.1 Network Element Noise Figure
  - 4.3.2 Impact of the ROADM without Wavelength Reuse
  - 4.3.3 Cohesive System Design
- 4.4 Impairment-Based Routing Metrics Other Than Noise Figure
- 4.5 Link Engineering
- 4.6 Regeneration Strategies
  - 4.6.1 Islands of Transparency
  - 4.6.2 Designated Regeneration Sites
  - 4.6.3 Selective Regeneration
- 4.7 Regeneration Architectures
  - 4.7.1 Back-to-Back WDM Transponders
  - 4.7.2 Regenerator Cards
  - 4.7.3 All-Optical Regeneration
- 4.8 Exercises
- 4.9 References

## **Chapter 5 Wavelength Assignment**

- 5.1 Introduction
- 5.2 Role of Regeneration in Wavelength Assignment
- 5.3 Multi-Step RWA
  - 5.3.1 Alleviating Wavelength Contention
- 5.4 One-Step RWA
  - 5.4.1 Topology Pruning
  - 5.4.2 Reachability Graph Transformation
  - 5.4.3 Flow-Based Methods
  - 5.4.4 ILP-Based Ring RWA
- 5.5 Wavelength Assignment Strategies
  - 5.5.1 First-Fit
  - 5.5.2 Most-Used
  - 5.5.3 Relative Capacity Loss
  - 5.5.4 Qualitative Comparison
- 5.6 Subconnection Ordering
  - 5.6.1 Graph Coloring
- 5.7 Bi-directional Wavelength Assignment
- 5.8 Wavelengths of Different Optical Reach
- 5.9 Nonlinear Impairments Due to Adjacent Wavelengths
  - 5.9.1 Mixed Line-Rate Systems
- 5.10 Alien Wavelengths
  - 5.10.1 Analog Services
- 5.11 Wavelength Contention and Network Efficiency
  - 5.11.1 Backbone Network Study
  - 5.11.2 Metro Network Study
  - 5.11.3 Study Conclusions
- 5.12 Exercises
- 5.13 References

## **Chapter 6 Grooming**

- 6.1 Introduction
- 6.2 End-to-End Multiplexing
- 6.3 Grooming
- 6.4 Grooming-Node Architecture
  - 6.4.1 Grooming Switch at the Nodal Core
  - 6.4.2 Grooming Switch at the Nodal Edge
  - 6.4.3 Intermediate Grooming Layer
- 6.5 Selection of Grooming Sites
  - 6.5.1 Hierarchical Grooming
- 6.6 Backhaul Strategies
- 6.7 Grooming Tradeoffs
  - 6.7.1 Cost vs. Path Distance
  - 6.7.2 Cost vs. Capacity
  - 6.7.3 Cost vs. Protection Capacity
  - 6.7.4 Grooming Design Guidelines
- 6.8 Grooming Strategies
  - 6.8.1 Initial Bundling and Routing
  - 6.8.2 Grooming Operations
- 6.9 Grooming Network Study
  - 6.9.1 Grooming Switch at All Nodes
  - 6.9.2 Grooming Switch at a Subset of the Nodes
- 6.10 Evolving Techniques for Addressing Power Consumption in the Grooming Layer
  - 6.10.1 Routing and Grooming with Energy Considerations
  - 6.10.2 Selective Randomized Load Balancing
  - 6.10.3 Optical Flow Switching (OFS)
  - 6.10.4 Optical Burst Switching (OBS)
  - 6.10.5 TWIN
  - 6.10.6 Lightrail
  - 6.10.7 Optical Packet Switching (OPS)
- 6.11 Exercises
- 6.12 References

## **Chapter 7 Optical Protection**

- 7.1 Introduction
- 7.2 Dedicated vs. Shared Protection
  - 7.2.1 Dedicated Protection
  - 7.2.2 Shared Protection
  - 7.2.3 Comparison of Dedicated and Shared Protection
- 7.3 Client-Side vs. Network-Side Protection
  - 7.3.1 Transponder Protection
  - 7.3.2 Wavelength Assignment with Network-Side Protection
- 7.4 Ring Protection vs. Mesh Protection
  - 7.4.1 Ring Protection
  - 7.4.2 Mesh Protection
- 7.5 Fault-Dependent vs. Fault-Independent Protection
  - 7.5.1 Link Protection
  - 7.5.2 Path Protection
  - 7.5.3 Segment Protection
- 7.6 Multiple Concurrent Failures
  - 7.6.1 Multiple Concurrent Failures – Without Catastrophes
  - 7.6.2 Multiple Concurrent Failures – With Catastrophes
  - 7.6.3 Protection Schemes for Multiple Concurrent Failures
  - 7.6.4 Protection through Dynamic Networking

- 7.7 Effect of Optical Amplifier Transients on Protection
- 7.8 Shared Protection Based on Pre-deployed Subconnections
  - 7.8.1 Cost vs. Spare Capacity Tradeoff
- 7.9 Shared Protection Based on Pre-cross-connected Bandwidth
  - 7.9.1 p-Cycles
  - 7.9.2 Pre-cross-connected Trails
- 7.10 Network Coding
- 7.11 Protection Planning Algorithms
  - 7.11.1 Algorithms for Dedicated Protection
  - 7.11.2 Algorithms for Shared Protection
- 7.12 Protection of Subrate Demands
  - 7.12.1 Wavelength-Level (Optical-Layer) Protection
  - 7.12.2 Subrate-Level (Grooming-Layer) Protection
  - 7.12.3 Wavelength-Level vs. Subrate-Level Protection
  - 7.12.4 Multilayer Protection
- 7.13 Fault Localization and Performance Monitoring
  - 7.13.1 Monitoring Structures
  - 7.13.2 Optical Performance Monitoring
- 7.14 Exercises
- 7.15 References

## **Chapter 8 Dynamic Optical Networking**

- 8.1 Introduction
- 8.2 Motivation for Dynamic Optical Networking
  - 8.2.1 Capacity Benefits of Dynamic Optical Networking
  - 8.2.2 Applications Enabled by a Dynamic Optical Network
  - 8.2.3 IP over a Dynamic Optical Layer
- 8.3 Centralized Path Computation and Resource Allocation
  - 8.3.1 PCE-Based Operation
  - 8.3.2 Advantages of Centralized Operation
  - 8.3.3 Disadvantages of Centralized Operation
  - 8.3.4 Multiple PCEs
- 8.4 Distributed Path Computation and Resource Allocation
  - 8.4.1 GMPLS-Based Operation
  - 8.4.2 Advantages of Decentralized Operation
  - 8.4.3 Disadvantages of Decentralized Operation
  - 8.4.4 Schemes to Minimize Contention
  - 8.4.5 Subconnection as the Label
- 8.5 Combining Centralized and Distributed Path Computation and Resource Allocation
- 8.6 Dynamic Protected Connections
- 8.7 Physical-Layer Impairments and Regeneration in a Dynamic Environment
  - 8.7.1 Regeneration in a PCE-Based Implementation
  - 8.7.2 Regeneration in a GMPLS-Based Implementation
- 8.8 Multi-Domain Dynamic Networking
  - 8.8.1 Backward-Recursive PCE-Based Computation (BRPC)
  - 8.8.2 Hierarchical PCEs
  - 8.8.3 Establishing Multi-Domain Connections
  - 8.8.4 Protected Multi-Domain Connections
- 8.9 Pre-deployment of Equipment
- 8.10 Scheduled or Advance Reservation Traffic
- 8.11 Software-Defined Networking (SDN)
  - 8.11.1 OpenFlow
- 8.12 Exercises
- 8.13 References

## **Chapter 9 Flexible Optical Networks**

- 9.1 Introduction
- 9.2 Fiber Capacity Limits
  - 9.2.1 Spectral Efficiency
  - 9.2.2 Expanded Transmission Band
  - 9.2.3 Multicore Fiber
  - 9.2.4 Multimode Fiber
  - 9.2.5 Architectural Approaches for Improved Capacity Utilization
- 9.3 Flexible-Grid Architectures
- 9.4 Gridless Architectures and Elastic Networks
  - 9.4.1 Superchannels
  - 9.4.2 Multipath Routing
  - 9.4.3 Bandwidth Squeezing Restoration
- 9.5 Routing and Spectrum Assignment (RSA)
  - 9.5.1 Routing
  - 9.5.2 Spectrum Assignment
  - 9.5.3 Spectral Elasticity
- 9.6 Spectral Defragmentation
- 9.7 Technologies for Flexible-Grid and Gridless Networks
  - 9.7.1 Gridless ROADMs
  - 9.7.2 Flexible Transmission for Gridless Networks
  - 9.7.3 Virtual Transponders
- 9.8 Flexible-Grid vs. Gridless Architectures
- 9.9 Programmable (or Adaptable) Transponders
  - 9.9.1 Data-Rate vs. Optical Reach
  - 9.9.2 Bandwidth vs. Optical Reach
  - 9.9.3 Utility of Programmable Transponders
- 9.10 Exercises
- 9.11 References

## **Chapter 10 Economic Studies**

- 10.1 Introduction
- 10.2 Assumptions
  - 10.2.1 Reference Network Topology
  - 10.2.2 Reference Traffic Set
  - 10.2.3 Cost Assumptions
- 10.3 Prove-In Point for Optical-Bypass Technology
  - 10.3.1 Comments on Comparing Costs
  - 10.3.2 O-E-O Technology with Extended Optical Reach
- 10.4 Optimal Optical Reach
  - 10.4.1 Add/Drop Percentage as a Function of Optical Reach
- 10.5 Optimal Topology from a Cost Perspective
- 10.6 Gridless vs. Conventional Architecture
  - 10.6.1 Conventional Grooming-Based Architecture
  - 10.6.2 Gridless Architecture
  - 10.6.3 Hybrid Gridless/Grooming Architecture
  - 10.6.4 Discussion
- 10.7 Optical Grooming in Edge Networks
- 10.8 General Conclusions
- 10.9 References

## **Chapter 11 C-Code for Routing Routines**

- 11.1 Introduction
- 11.2 Definitions

- 11.3 Breadth First Search Shortest Paths
- 11.4 K-Shortest Paths
- 11.5 N-Shortest Diverse Paths
- 11.6 Minimum Steiner Tree
  - 11.6.1 Minimum Spanning Tree with Enhancement
  - 11.6.2 Minimum Paths
- 11.7 References

**Appendix: Suggestions for RFI/RFP Network Design Exercises**
